

Python `print()` Function — Beginner Notebook (Lecture 1)

This notebook is designed for **students who have just learned the basic `print()` function**.

■ Includes only:

- Basic `print()`
- Printing text & numbers
- Multiple values
- `sep` and `end`
- Escape characters (`\n`, `\t`)
- Simple patterns **without loops**
- A simple **menu display** (print-only)

Run cells top-to-bottom.

1) What is `print()`?

`print()` is used to **display output** on the screen (console).

In [1]:

```
print("Hello, World!")
```

2) Printing Text and Numbers

In [2]:

```
print("My name is Ali")
print("Age:", 20)
print(10)
print(10 + 5)
```

3) Printing Multiple Values

By default, Python puts a **space** between values.

In [3]:

```
print("Python", "is", "easy")
print("Marks:", 92, "Grade:", "A")
```

4) `sep` (Separator)

Use `sep` to change the separator between printed values.

In [4]:

```
print("Python", "AI", "Course", sep=" | ")
print("2025", "12", "30", sep="-")
```

5) end (Ending)

By default, `print()` ends with a new line. Use `end` to change it.

In [5]:

```
print("Hello", end=" ")
print("Students!")

print("Loading", end="...")
print("Done!")
```

6) New Line and Tab (Escape Characters)

- `\n` = new line
- `\t` = tab

In [6]:

```
print("Line 1\nLine 2\nLine 3")
print("Name\tScore")
print("Ali\t95")
print("Sara\t88")
```

Part A — Patterns (No Loops Yet)

These patterns use only `print()` statements.

In [7]:

```
# Star pattern (triangle)
print("")
print("***")
print("****")
print("*****")
print("*****")
```

In [8]:

```
# Number pattern
print("1")
print("12")
print("123")
print("1234")
print("12345")
```

Part B — Menu Display (Print Only)

This is a simple menu screen using `print()` only (no input/logic yet).

In [9]:

```
print("="*30)
print("      SIMPLE MENU")
print("="*30)
```

```
print("1) Add Two Numbers")
print("2) Subtract Two Numbers")
print("3) Print a Pattern")
print("0) Exit")
print("="*30)
```

Practice Exercises (Beginner)

Create new code cells below and solve these:

Exercises

1. Print your **name** on the first line and your **city** on the second line.
2. Print AI, ML, DL separated by -> using sep.
3. Print Hello and world on the same line using end.
4. Print this using \n:
- I love Python
- I love AI
5. Create a menu like the example, but add one more option: 4) About Course.
