

Assignment 01 (10 Marks)

Create a **poster or infographic** (digital) that visually explains:

1. The Evolution Path

- Show how processor design evolved:
 - **8086 (CISC era)** → Complex instructions, microcoded control, higher transistor count.
 - **ARM (RISC era)** → Reduced instructions, energy efficiency, dominant in mobile.
 - **RISC-V (open-source era)** → Modular design, educational and industrial adoption.

2. Key Comparison Dimensions

- **Instruction Set Size**
- **Execution Speed / Pipeline Design**
- **Power Efficiency**
- **Design Philosophy (Closed vs. Open)**
- **Applications** (e.g., PCs, smartphones, IoT, robotics)

3. Timeline or Flow Layout

- Use a **horizontal or circular timeline** from 1978 → 2025.
- Include processor logos, diagrams, or representative chips (Intel, ARM Cortex, SiFive, etc.).

4. Highlight the RISC-V Revolution

- Emphasize how RISC-V is **open, customizable, and modular**, unlike proprietary ISAs (Intel x86 or ARM).
- Mention major companies adopting RISC-V (e.g., NVIDIA, Google, Western Digital).

Design Guidelines:

- Format: Poster or Infographic (A3 or A4, landscape preferred).
- Tools: Canva, PowerPoint, Figma, Visme, or any free design tool.
- Include:
 - Icons, minimal text, and simple graphics.
 - A clear **title** and short **tagline** (e.g., “Simpler. Smarter. Open — The RISC-V Era”).
 - Use colors to distinguish eras (e.g., Blue = CISC, Green = RISC, Orange = RISC-V).

Deliverables:

- A single image or PDF file (1 page).
- A short (150–200 words) description explaining the transition you illustrated.
